

Hello Developer,

Client seriously want to develop a radio website which is fully unique. This is your main agenda to make the radio website unique, don't worried you need not to be think, the idea is already generated by some genius but The person is not too much genius because of that The person cannot implement it and that's why He / She wants to hire you to do this job.

UI Explanation:

Visit: <http://fakemusic.fr/>

Is not the website beautiful, Yes is it, so you have to clone it, but own way, you can't use their CSS or JavaScript, you have to code it in your own way.

Core System Develop:

You have to build a system which can:

User View:

- Define user by their IP. { if a user come from Bangladesh then it's Must be verify it and store in Location Variable[] }
- In Database Music store against the country and the music player show user music according to Location Variable value [].

Members View:

- Member can upload song according to <http://fakemusic.fr>.
- It also connect iTunes and Beat port via API.
- Every album has a country incur which is using Google map pen tools.
More clearness look at the picture please:

Red board area is selected by member and only those areas user can see that album.

- Member can fixed their album prices and user can buy it by only PayPal.

Super admin:

- Do everything.
- Can restricted user IP.
- Can restricted member IP.

Database:

Objectives of normalization are follows.

- Minimizing data redundancy
- Minimizing data restructuring
- Minimizing I/O by redesign transaction sizes
- Enforcing referencing integrity.

Script Writing Approach:

- Must OOP
- Must MVC
- Clean Code

I hope it's clear to you now, I hope you deliver it in time.

Regards
